Image velocity of a point moving in the scene

Image velocity of a point moving in the scene

Discussion: \mathbf{v}_i is orthogonal to $(\mathbf{r}_o \times \mathbf{v}_o)$ and $\hat{Z} \rightarrow$ lies in image plane

Motion field

$$\mathbf{v}_{i} = \frac{d\mathbf{r}_{i}}{dt} = f' \frac{\left(\mathbf{r}_{o} \cdot \hat{\mathbf{Z}}\right) \mathbf{v}_{o} - \left(\mathbf{v}_{o} \cdot \hat{\mathbf{Z}}\right) \mathbf{r}_{o}}{\left(\mathbf{r}_{o} \cdot \hat{\mathbf{Z}}\right)^{2}} = f' \frac{\left(\mathbf{r}_{o} \times \mathbf{v}_{o}\right) \times \hat{\mathbf{Z}}}{\left(\mathbf{r}_{o} \cdot \hat{\mathbf{Z}}\right)^{2}}$$

Set $\widehat{Z} = \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}$ and do the math (see handwritten notes G. Gerig):

$$v_{ix} = \frac{v_{ox}f}{Z} - \frac{xv_{oz}}{Z}$$
$$v_{iy} = \frac{v_{oy}f}{Z} - \frac{yv_{oz}}{Z}$$

Discussion:

Component of optical flow in image only due to v_x and v_y , object motion parallel to image plane.

Component of optical flow in image only due to v_z , object motion towards/away from camera.

$$v_{ix} = \frac{v_{ox}f}{Z} - \frac{xv_{oz}}{Z}$$
$$v_{iy} = \frac{v_{oy}f}{Z} - \frac{z}{Z}$$

Reformulate: perspective projection of velocity:

$$\begin{bmatrix} v_{ix} \\ v_{iy} \end{bmatrix} = \begin{bmatrix} f & 0 & -x \\ 0 & f & -y \end{bmatrix} \frac{1}{Z} \begin{bmatrix} v_{ox} \\ v_{oy} \\ v_{oz} \end{bmatrix}$$

Rigid pose estimation

• Head pose model: 6 DOF

Please note notation: T stands for translational motion of object, Ω for rotational component.

• 3-D velocity:

$$V = T + \Omega \times P = T - \hat{\mathbf{P}}\Omega = \begin{bmatrix} \mathbf{I} & -\hat{\mathbf{P}} \begin{bmatrix} T \\ \Omega \end{bmatrix}$$

$$\hat{\mathbf{P}} = [\mathbf{P}_x]$$
(skew-sym.)

$$V = \begin{bmatrix} V_x \\ V_y \\ V_z \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 & Z & -Y \\ 0 & 1 & 0 & -Z & 0 & X \\ 0 & 0 & 1 & Y & -X & 0 \end{bmatrix} \begin{bmatrix} T \\ \Omega \end{bmatrix}$$

• Perspective projection

$$\begin{bmatrix} v_{ix} \\ v_{iy} \end{bmatrix} = \begin{bmatrix} f & 0 & -x \\ 0 & f & -y \end{bmatrix} \frac{1}{Z} \begin{bmatrix} v_{ox} \\ v_{oy} \\ v_{oz} \end{bmatrix}$$

• Combine

$$V = \begin{bmatrix} V_{x} \\ V_{y} \\ V_{z} \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 & Z & -Y \\ 0 & 1 & 0 & -Z & 0 & X \\ 0 & 0 & 1 & Y & -X & 0 \end{bmatrix} \begin{bmatrix} T \\ \Omega \end{bmatrix}$$
$$\begin{bmatrix} v_{ix} \\ v_{iy} \end{bmatrix} = \begin{bmatrix} f & 0 & -x \\ 0 & f & -y \end{bmatrix} \frac{1}{Z} \begin{bmatrix} v_{ox} \\ v_{oy} \\ v_{oz} \end{bmatrix}$$

• Rigid Motion (for small v): $\begin{vmatrix} v_x \\ v_y \end{vmatrix} = \mathbf{H} \begin{bmatrix} T \\ \Omega \end{bmatrix}$

$$\mathbf{H} = \begin{bmatrix} f & 0 & -x \\ 0 & f & -y \end{bmatrix} \frac{1}{Z'} \begin{bmatrix} 1 & 0 & 0 & 0 & Z & -Y \\ 0 & 1 & 0 & -Z & 0 & X \\ 0 & 0 & 1 & Y & -X & 0 \end{bmatrix}$$

Perspective projection of 3-D velocity * 3-D velocity at point P (from $\begin{bmatrix} T \\ \Omega \end{bmatrix}$)

Hard to solve with just optic flow vectors! (but see Horn 17.3-17.5).

* Convert from scene to image: $\bar{p} = f \frac{\bar{P}}{Z}$

$$\begin{bmatrix} v_x \\ v_y \end{bmatrix} = \mathbf{H} \begin{bmatrix} T \\ \Omega \end{bmatrix}$$
$$\mathbf{H} = \begin{bmatrix} f & 0 & -x \\ 0 & f & -y \end{bmatrix} \frac{1}{Z'} \begin{bmatrix} 1 & 0 & 0 & 0 & Z & -Y \\ 0 & 1 & 0 & -Z & 0 & X \\ 0 & 0 & 1 & Y & -X & 0 \end{bmatrix}$$
$$\mathbf{v}_x = \frac{T_z x - T_x f}{Z} - \omega_y f + \omega_z y + \frac{\omega_x x y}{f} - \frac{\omega_y x^2}{f}$$
$$v_y = \frac{T_z y - T_y f}{Z} + \omega_x f - \omega_z x - \frac{\omega_y x y}{f} + \frac{\omega_x y^2}{f}.$$

Flow field of rigid motion

In components, and using (8.5), (8.6) read

$$v_x = \frac{T_z x - T_x f}{Z} - \omega_y f + \omega_z y + \frac{\omega_x x y}{f} - \frac{\omega_y x^2}{f}$$
$$v_y = \frac{T_z y - T_y f}{Z} + \omega_x f - \omega_z x - \frac{\omega_y x y}{f} + \frac{\omega_x y^2}{f}.$$

Notice that the motion field is the sum of two components, one of which depends translation only, the other on rotation only. In particular, the translational compone of the motion field are

$$v_x^T = \frac{T_z x - T_x f}{Z}$$
$$v_y^T = \frac{T_z y - T_y f}{Z},$$

and the rotational components are

$$v_x^{\omega} = -\omega_y f + \omega_z y + \frac{\omega_x x y}{f} - \frac{\omega_y x^2}{f}$$
$$v_y^{\omega} = \omega_x f - \omega_z x - \frac{\omega_y x y}{f} + \frac{\omega_x y^2}{f}.$$

Trucco & Verri p. 184

Flow field of rigid motion

Notice that the motion field is the sum of two components, one of which depends translation only, the other on rotation only. In particular, the translational compone of the motion field are

$$v_x^T = \frac{T_z x - T_x f}{Z}$$
$$v_y^T = \frac{T_z y - T_y f}{Z}$$

and the rotational components are

$$v_x^{\omega} = -\omega_y f + \omega_z y + \frac{\omega_x x y}{f} - \frac{\omega_y x^2}{f}$$
$$v_y^{\omega} = \omega_x f - \omega_z x - \frac{\omega_y x y}{f} + \frac{\omega_x y^2}{f}.$$

Discussion:

- Motion field of translational component depends on T and depth Z. For increasing Z, velocity becomes smaller.
- Motion field that depends on angular velocity does NOT carry information on depth Z!

Special Case: Pure Translation

$$v_x = \frac{T_z x - T_x f}{Z}$$
$$v_y = \frac{T_z y - T_y f}{Z}$$

Choose x₀ and y₀ so that v becomes 0

$$x_0 = f T_x / T_z$$
$$y_0 = f T_y / T_z,$$

$$v_x = (x - x_0) \frac{T_z}{Z}$$

$$v_y = (y - y_0) \frac{T_z}{Z}.$$

Says that motion field of a pure translation is radial, it consists of vectors radiating from a common origin $p_0=(x_0,y_0)$, which is the vanishing point.

Trucco & Verri p. 184/185 See also F&P Chapter 10.1.3 p. 218

Special Case: Pure Translation

Figure 8.4 The three types of motion field generated by translational motion. The filled square marks the instantaneous epipole.

Focus of expansion/contraction:

$$x_0 = f T_x / T_z$$
$$y_0 = f T_y / T_z,$$

Trucco & Verri p. 184/185 See also F&P Chapter 10.1.3 p. 218

FOE for Translating Camera

Moving Plane (Trucco&Verri p.187)

$$v_x = \frac{1}{fd}(a_1x^2 + a_2xy + a_3fx + a_4fy + a_5f^2)$$

$$v_{y} = \frac{1}{fd} (a_{1}xy + a_{2}y^{2} + a_{6}fy + a_{7}fx + a_{8}f^{2})$$

$$a_{1} = -d\omega_{y} + T_{z}n_{x}, \quad a_{2} = d\omega_{x} + T_{z}n_{y},$$

$$a_{3} = T_{z}n_{z} - T_{x}n_{x}, \quad a_{4} = d\omega_{z} - T_{x}n_{y},$$

$$a_{5} = -d\omega_{y} - T_{x}n_{z}, \quad a_{6} = T_{z}n_{z} - T_{y}n_{y},$$

$$a_{7} = -d\omega_{z} - T_{y}n_{x}, \quad a_{8} = d\omega_{x} - T_{y}n_{z}.$$

- Motion field of planar surface is quadratic polynomial in (f,x,y)
- Same motion field produced by two different planes w. two different 3D motions
- Not unique: co-planar set of points (remember 8 point algorithm for calibration)

Application (Szeklisky): Motion representations

• How can we describe this scene?

Additional Slides, not discussed in class.

Horn and Schunck

- Least squares formulation:
- Differentiate integrand w.r.t. Z, set to 0, solve for each (x,y)
- Differentiate equation w.r.t. tx, ty, tz, set to 0, solve
- (see Chapter 17 Horn and Schunck)

• Rigid Motion (for small v): $\begin{vmatrix} v_x \\ v_y \end{vmatrix} = \mathbf{H} \begin{bmatrix} T \\ \Omega \end{bmatrix}$

$$\mathbf{H} = \begin{bmatrix} f & 0 & -x \\ 0 & f & -y \end{bmatrix} \frac{1}{Z'} \begin{bmatrix} 1 & 0 & 0 & 0 & Z & -Y \\ 0 & 1 & 0 & -Z & 0 & X \\ 0 & 0 & 1 & Y & -X & 0 \end{bmatrix}$$
Perspective projection 3-D velocity at point P

Hard to solve with just optic flow vectors! (but see Horn 17.3-17.5).

Instead, *Direct method* combines constraint linearly with BCCE!

(BCCE: Brightness Change Constraint Equation)

Direct Rigid Motion Estimation

• Brightness Change Constraint

$$I(x, y, t) = I(x + v_x, y + v_y, t + 1)$$

$$\frac{dI}{dx}v_x + \frac{dI}{dy}v_y + \frac{dI}{dt} = 0$$

$$\begin{bmatrix} -\frac{dI}{dt} \end{bmatrix} = \begin{bmatrix} \frac{dI}{dx} & \frac{dI}{dy} \end{bmatrix} \begin{bmatrix} v_x \\ v_y \end{bmatrix}$$

Direct Rigid Motion Estimation

Brightness Change Constraint

$$\begin{bmatrix} -\frac{dI}{dt} \end{bmatrix} = \begin{bmatrix} \frac{dI}{dx} & \frac{dI}{dy} \end{bmatrix} \begin{bmatrix} v_x \\ v_y \end{bmatrix}$$

• Rigid Motion Model

$$\begin{bmatrix} v_x \\ v_y \end{bmatrix} = \mathbf{H} \begin{bmatrix} T \\ \mathbf{\Omega} \end{bmatrix}$$

$$\mathbf{H} = \begin{bmatrix} f & 0 & -x \\ 0 & f & -y \end{bmatrix} \frac{1}{Z'} \begin{bmatrix} 1 & 0 & 0 & 0 & Z & -Y \\ 0 & 1 & 0 & -Z & 0 & X \\ 0 & 0 & 1 & Y & -X & 0 \end{bmatrix}$$

Direct Motion Estimation

• One equation per pixel:

$$\begin{bmatrix} -\frac{dI}{dt} \end{bmatrix} = \begin{bmatrix} \frac{dI}{dx} & \frac{dI}{dy} \end{bmatrix} \begin{bmatrix} f & 0 & -x \\ 0 & f & -y \end{bmatrix} \frac{1}{Z'} \begin{bmatrix} 1 & 0 & 0 & 0 & Z & -Y \\ 0 & 1 & 0 & -Z & 0 & X \\ 0 & 0 & 1 & Y & -X & 0 \end{bmatrix} \begin{bmatrix} T \\ \Omega \end{bmatrix}$$

First, convert X,Y from screen coordinates to pixel coordinates....

Direct Motion Estimation

• One equation per pixel:

$$\begin{bmatrix} -\frac{dI}{dt} \end{bmatrix} = \begin{bmatrix} \frac{dI}{dx} & \frac{dI}{dy} \end{bmatrix} \begin{bmatrix} f & 0 & -x \\ 0 & f & -y \end{bmatrix} \frac{1}{Z'} \begin{bmatrix} 1 & 0 & 0 & 0 & Z & -yZ'/f \\ 0 & 1 & 0 & -Z & 0 & xZ'/f \\ 0 & 0 & 1 & yZ'/f & -xZ'/f & 0 \end{bmatrix} \begin{bmatrix} T \\ \Omega \end{bmatrix}$$

• Still hard!

. . .

- Z unknown; assume surface shape...
 - Negahdaripour & Horn Planar
 - Black and Yacoob Affine
 - Basu and Pentland; Bregler and Malik Ellipsoidal
 - Essa et al. Polygonal approximation

Direct Motion Estimation

• One equation per pixel:

$$\begin{bmatrix} -\frac{dI}{dt} \end{bmatrix} = \begin{bmatrix} \frac{dI}{dx} & \frac{dI}{dy} \end{bmatrix} \begin{bmatrix} f & 0 & -x \\ 0 & f & -y \end{bmatrix} \frac{1}{Z'} \begin{bmatrix} 1 & 0 & 0 & 0 & Z & -yZ'/f \\ 0 & 1 & 0 & -Z & 0 & xZ'/f \\ 0 & 0 & 1 & yZ'/f & -xZ'/f & 0 \end{bmatrix} \begin{bmatrix} T \\ \Omega \end{bmatrix}$$

"Direct Depth"

Use real-time stereo!

- Gives Z directly; no approximate model needed
- Express Direct Constraint on Depth Gradient

 $I(x, y, t) = I(x + v_x, y + v_y, t + 1)$ $Z(x, y, t) = Z(x + v_x, y + v_y, t + 1) - v_z$

$$\frac{dZ}{dx}v_x + \frac{dZ}{dy}v_y + \frac{dZ}{dt} - v_z = 0$$

Direct Depth

- 3-D Depth and Brightness Constraint Equations:
- Orthographic

$$\begin{bmatrix} -dI/dt \\ -dZ/dt \end{bmatrix} = \begin{bmatrix} dI/dx & dI/dy & 0 \\ dZ/dx & dZ/dy & -1 \end{bmatrix} \begin{bmatrix} v_x \\ v_y \\ v_z \end{bmatrix}$$

• Perspective

$$\begin{bmatrix} -dI/dt \\ -dZ/dt \end{bmatrix} = \begin{bmatrix} fdI/dx & fdI/dy & -ydI/dy - xdI/dx \\ fdZ/dx & fdZ/dy & -1 \end{bmatrix} \frac{1}{Z'} \begin{vmatrix} v_x \\ v_y \\ v_z \end{vmatrix}$$

Direct Depth

Combined with rigid motion model:

• Orthographic

$$\begin{bmatrix} -dI/dt \\ -dZ/dt \end{bmatrix} = \begin{bmatrix} dI/dx & dI/dy & 0 \\ dZ/dx & dZ/dy & -1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & 0 & Z & -y \\ 0 & 1 & 0 & -Z & 0 & x \\ 0 & 0 & 1 & y & -x & 0 \end{bmatrix} \begin{bmatrix} T \\ \Omega \end{bmatrix}$$

• Perspective

 $\begin{bmatrix} -dI/dt \\ -dZ/dt \end{bmatrix} = \begin{bmatrix} fdI/dx & fdI/dy & -ydI/dy - xdI/dx \\ fdZ/dx & fdZ/dy & -1 \end{bmatrix} \frac{1}{Z'} \begin{bmatrix} 1 & 0 & 0 & 0 & Z & -yZ'/f \\ 0 & 1 & 0 & -Z & 0 & xZ'/f \\ 0 & 0 & 1 & yZ'/f & -xZ'/f & 0 \end{bmatrix} \begin{bmatrix} T \\ \Omega \end{bmatrix}$

One system per pixel, same T, Ω . Solve with QR or SVD. [Harville et. al]

Outline

- Why layers?
- 2-D layers [Wang & Adelson 94; Weiss 97]
- 3-D layers [Baker et al. 98]
- Layered Depth Images [Shade et al. 98]
- Transparency [Szeliski et al. 00]

Layered motion

- Advantages:
- can represent occlusions / disocclusions
- each layer's motion can be smooth
- video segmentation for semantic processing
- Difficulties:
- how do we determine the correct number?
- how do we assign pixels?
- how do we model the motion?

Frame 0

Frame 80

Background scene (players removed)

Complete synopsis of the video

Background modeling (MPEG-4)

 Convert masked images into a background sprite for layered video coding

What are layers?

- [Wang & Adelson, 1994]
- intensities
- alphas
- velocities

Intensity map

Alpha map

Intensity map

Velocity map

Frame 1

Frame 3

How do we composite them?

Figure 3: A flow chart for compositing a series of layers. The box labeled "cmp" generates the complement of alpha, $(1 - \alpha)$

Figure 4: A flow chart for compositing that incorporates velocity maps, V, and delta maps, D.

2/1/2005

Motion estimation

45

How do we form them?

2/1/2005

How do we form them?

Figure 7: (a) Frame 1 warped with an affine transformation to align the flowerbed region with that of frame 15. (b) Original frame 15 used as reference. (c) Frame 30 warped with an affine transformation to align the flowerbed region with that of frame 15.

Figure 8: Accumulation of the flowerbed. Image intensities are obtained from a temporal median operation on the motion compensated images. Only the regions belonging to the flowerbed layer is accumulated in this image. Note also occluded regions are correctly recovered by accumulating data over many frames.

How do we estimate the layers?

- 1. compute coarse-to-fine flow
- 2. estimate affine motion in blocks (regression)
- 3. cluster with *k-means*
- 4. assign pixels to best fitting affine region
- 5. re-estimate affine motions in each

Layer synthesis

- For each layer:
- stabilize the sequence with the affine motion
- compute median value at each pixel
- Determine occlusion relationships

Residual Planar Parallax Motion (Plane+Parallax)

Original sequence Plane-aligned sequence I

Recovered shape

Block sequence from [Kumar-Anandan-Hanna'94]

"Given two views where motion of points on a parametric surface has been compensated, the residual parallax is an epipolar field"

Residual Planar Parallax Motion

The intersection of the two line constraints <u>uniquely</u> defines the displacement.

Dense 3D Reconstruction (Plane+Parallax)

Original sequence

Plane-aligned sequence

Recovered shape
