Introduction

- Supercomputers are used to simulate complex scientific phenomena
- These supercomputers are clusters of individual computers called nodes that are connected to each other
- Programs developed to perform these simulations tend to be very large and complicated
- Analysis and Visualizations of these programs provides insights into the execution behavior and exposes areas of the program that can be targeted for optimizations
- We present a tool that performs such analysis and visualization by providing views and plots

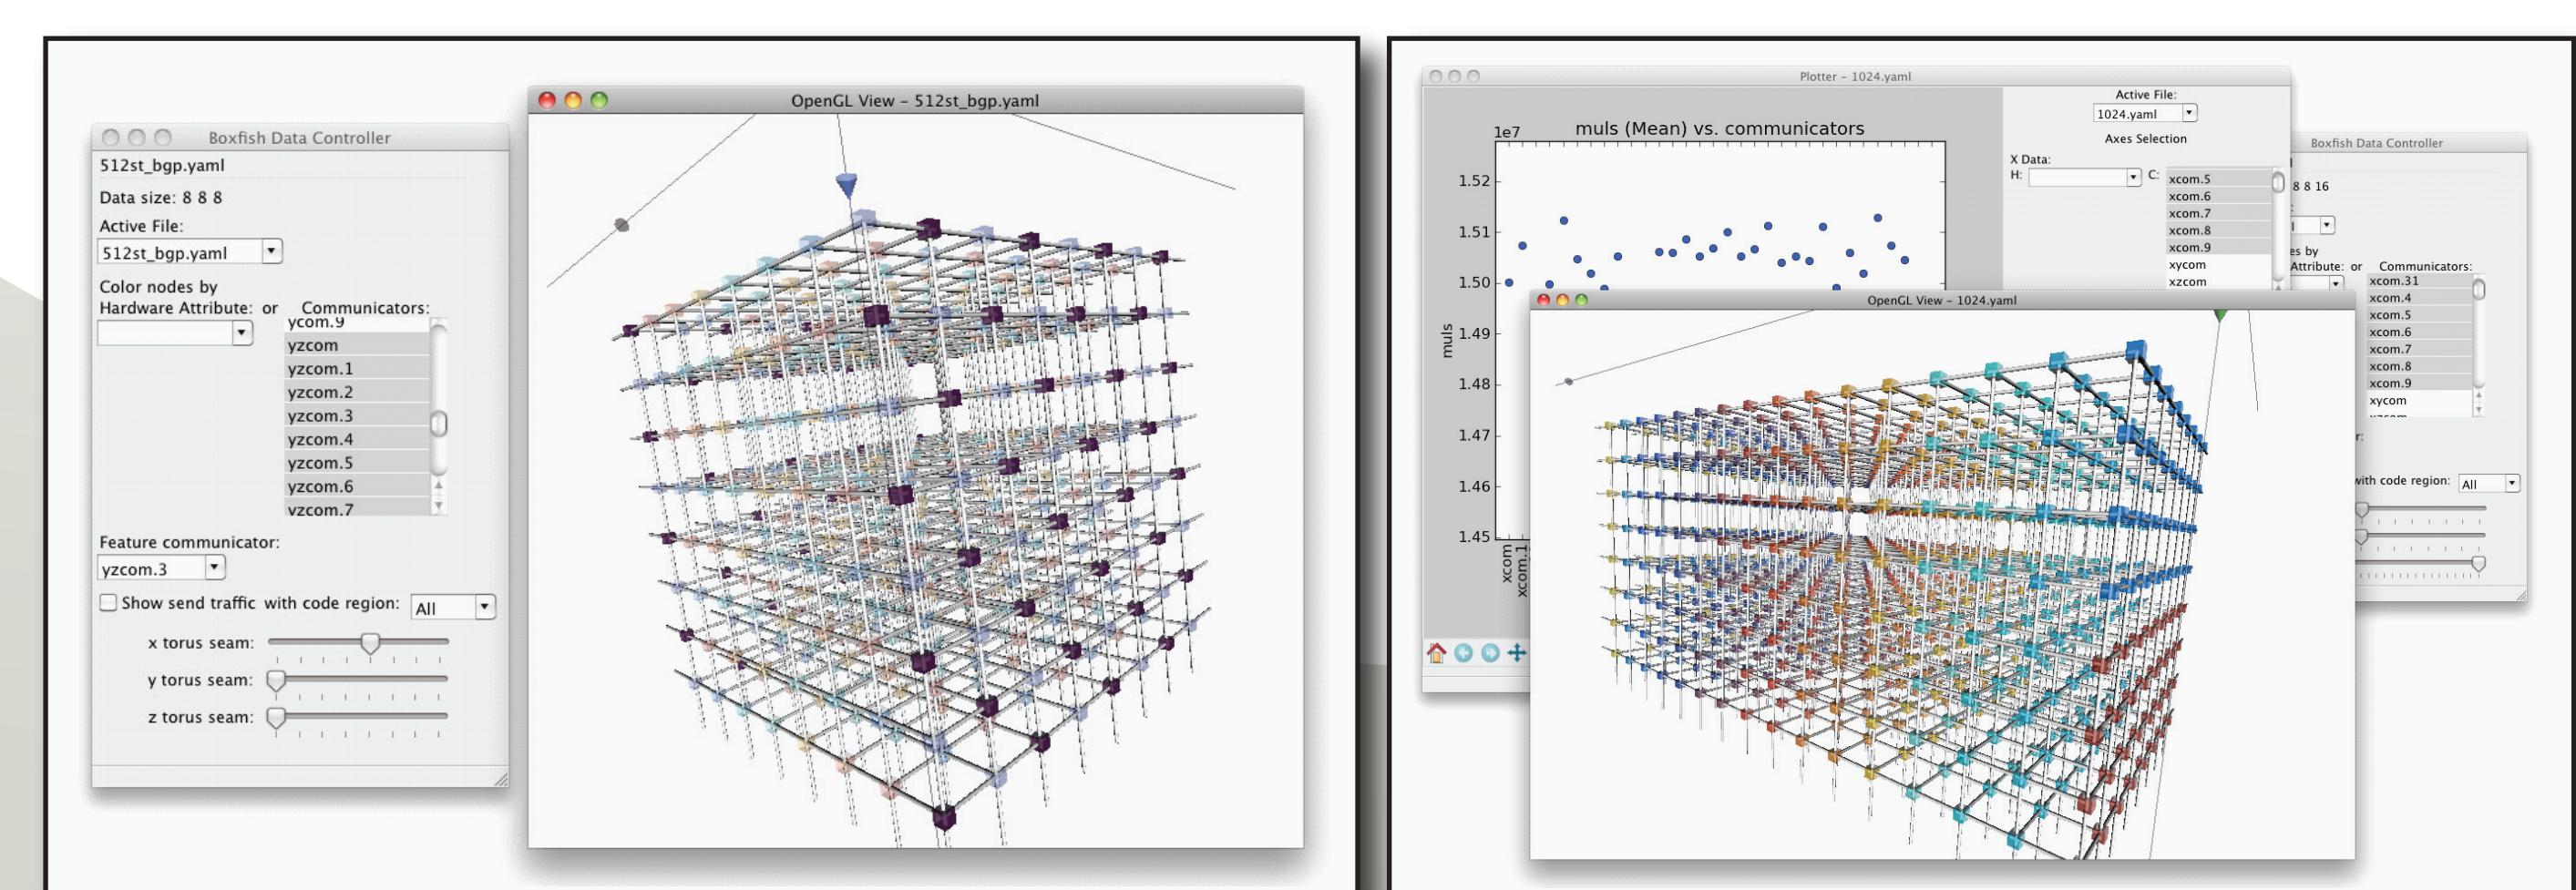

Visualization of the various parts of the high resolution image that were processed on CPU(blue) and GPU(red)

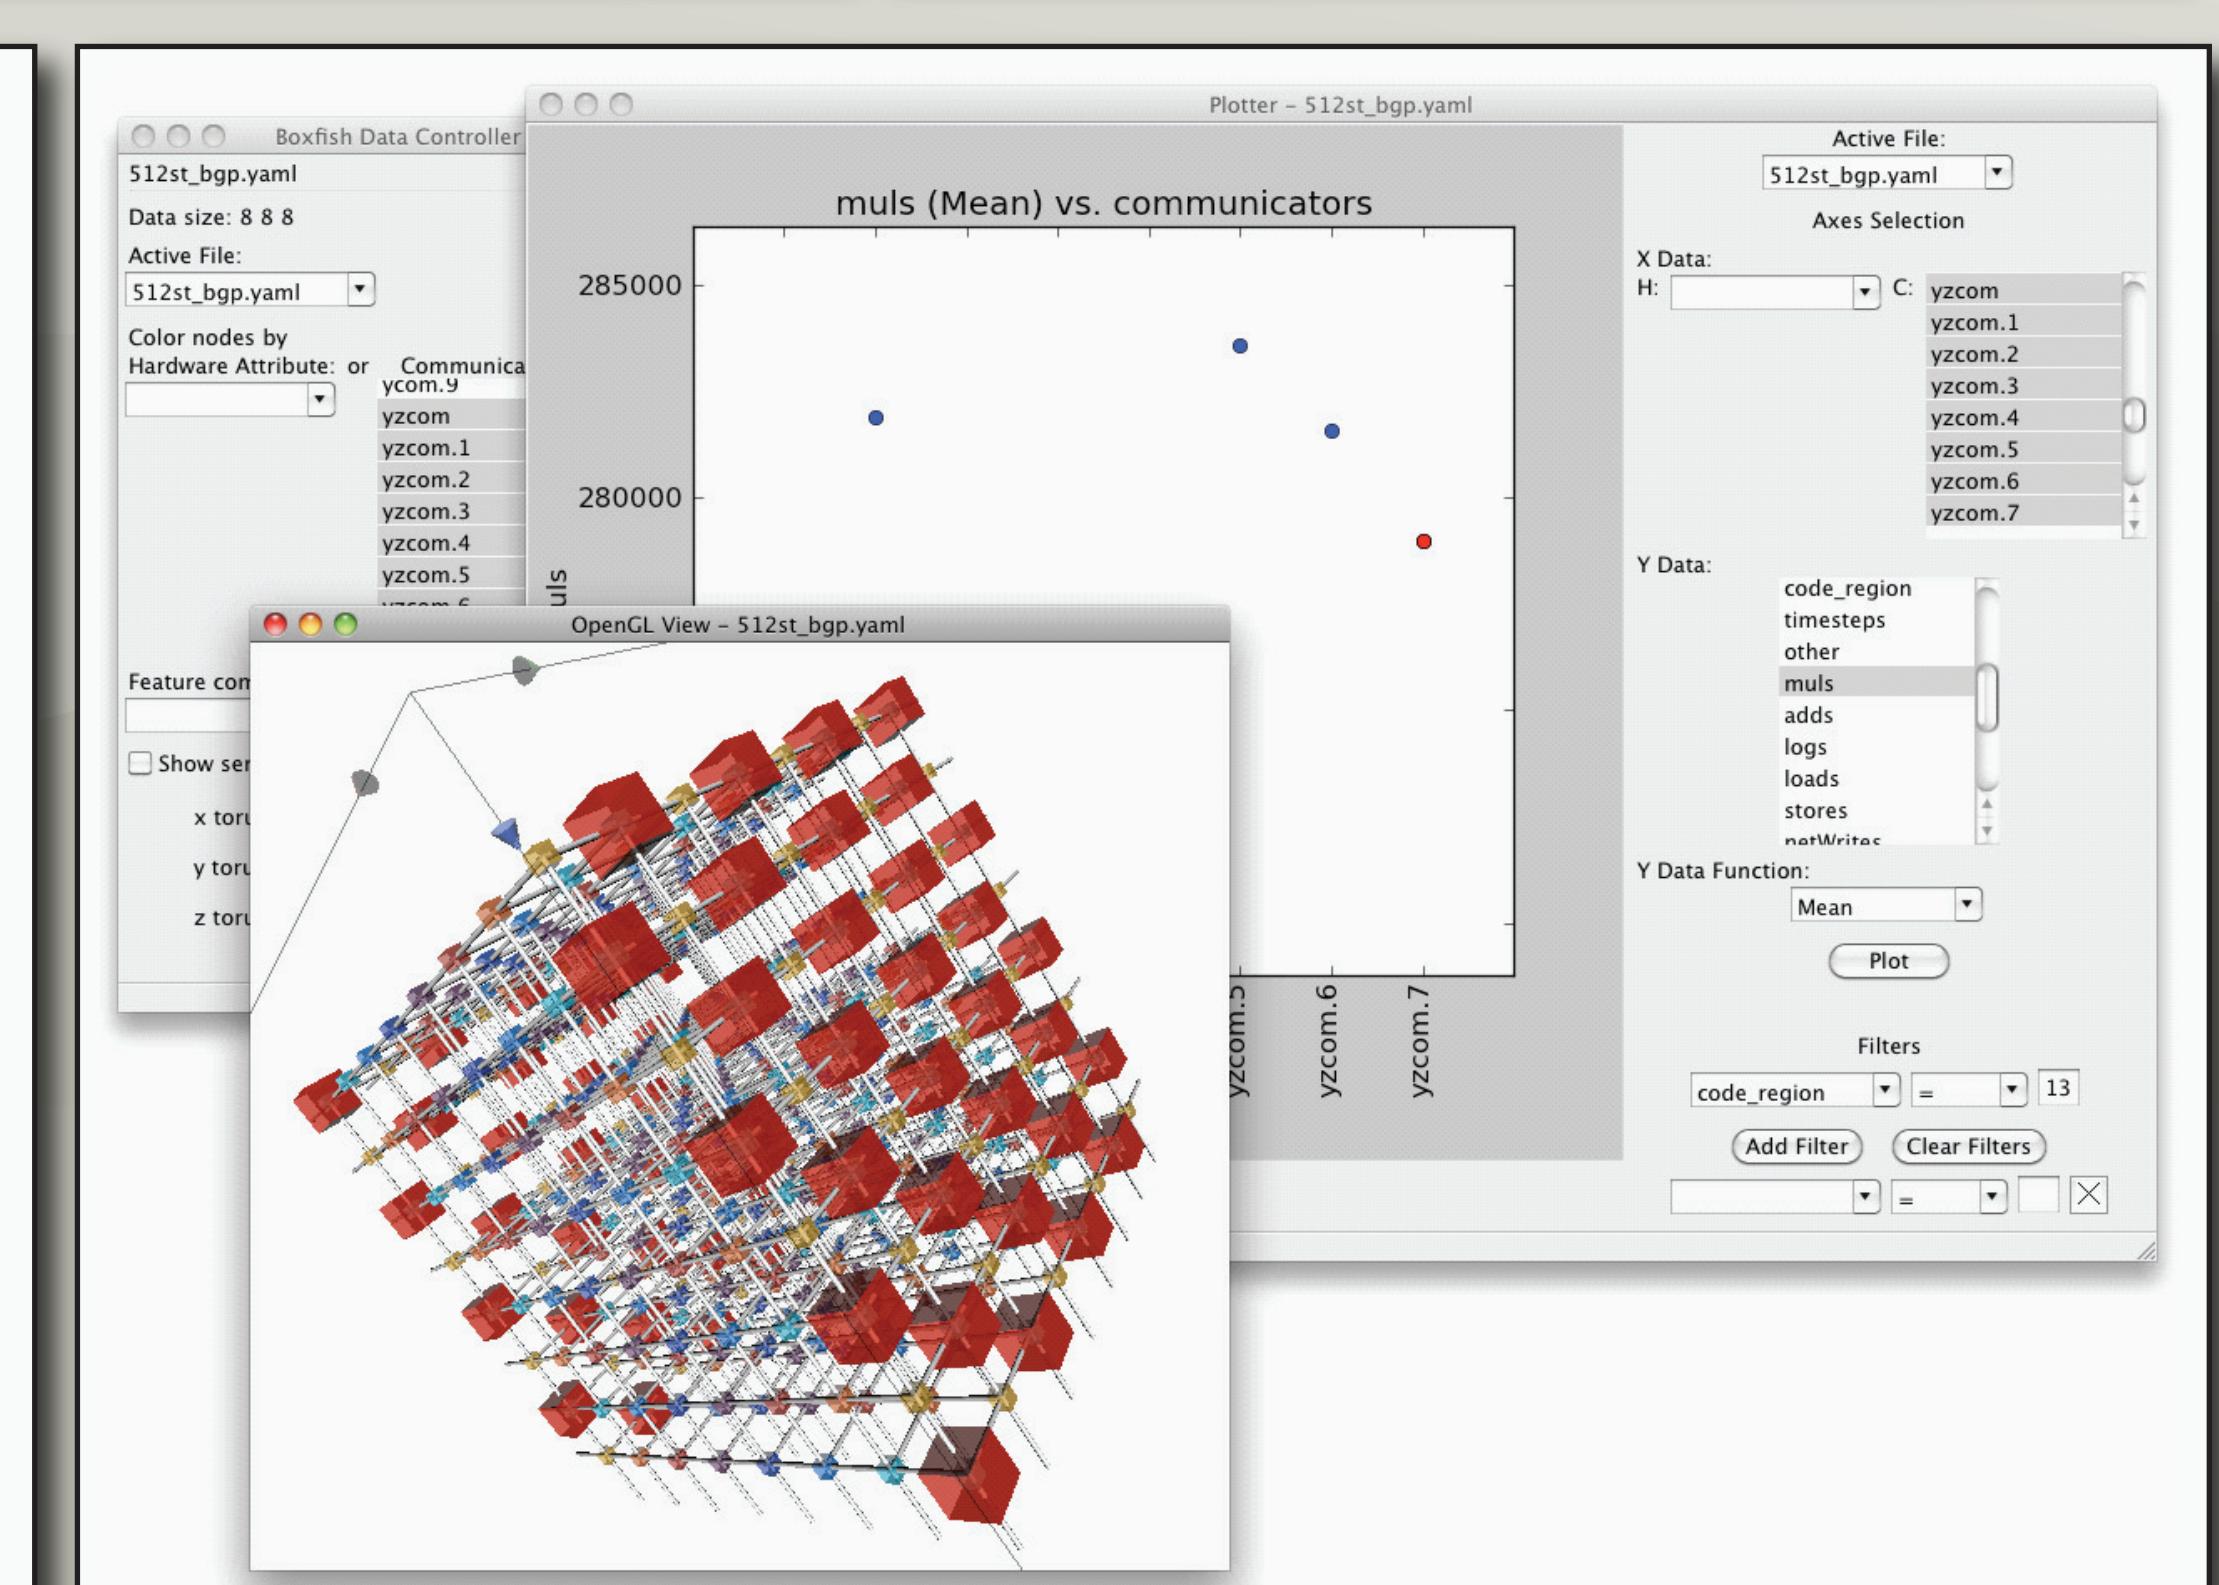

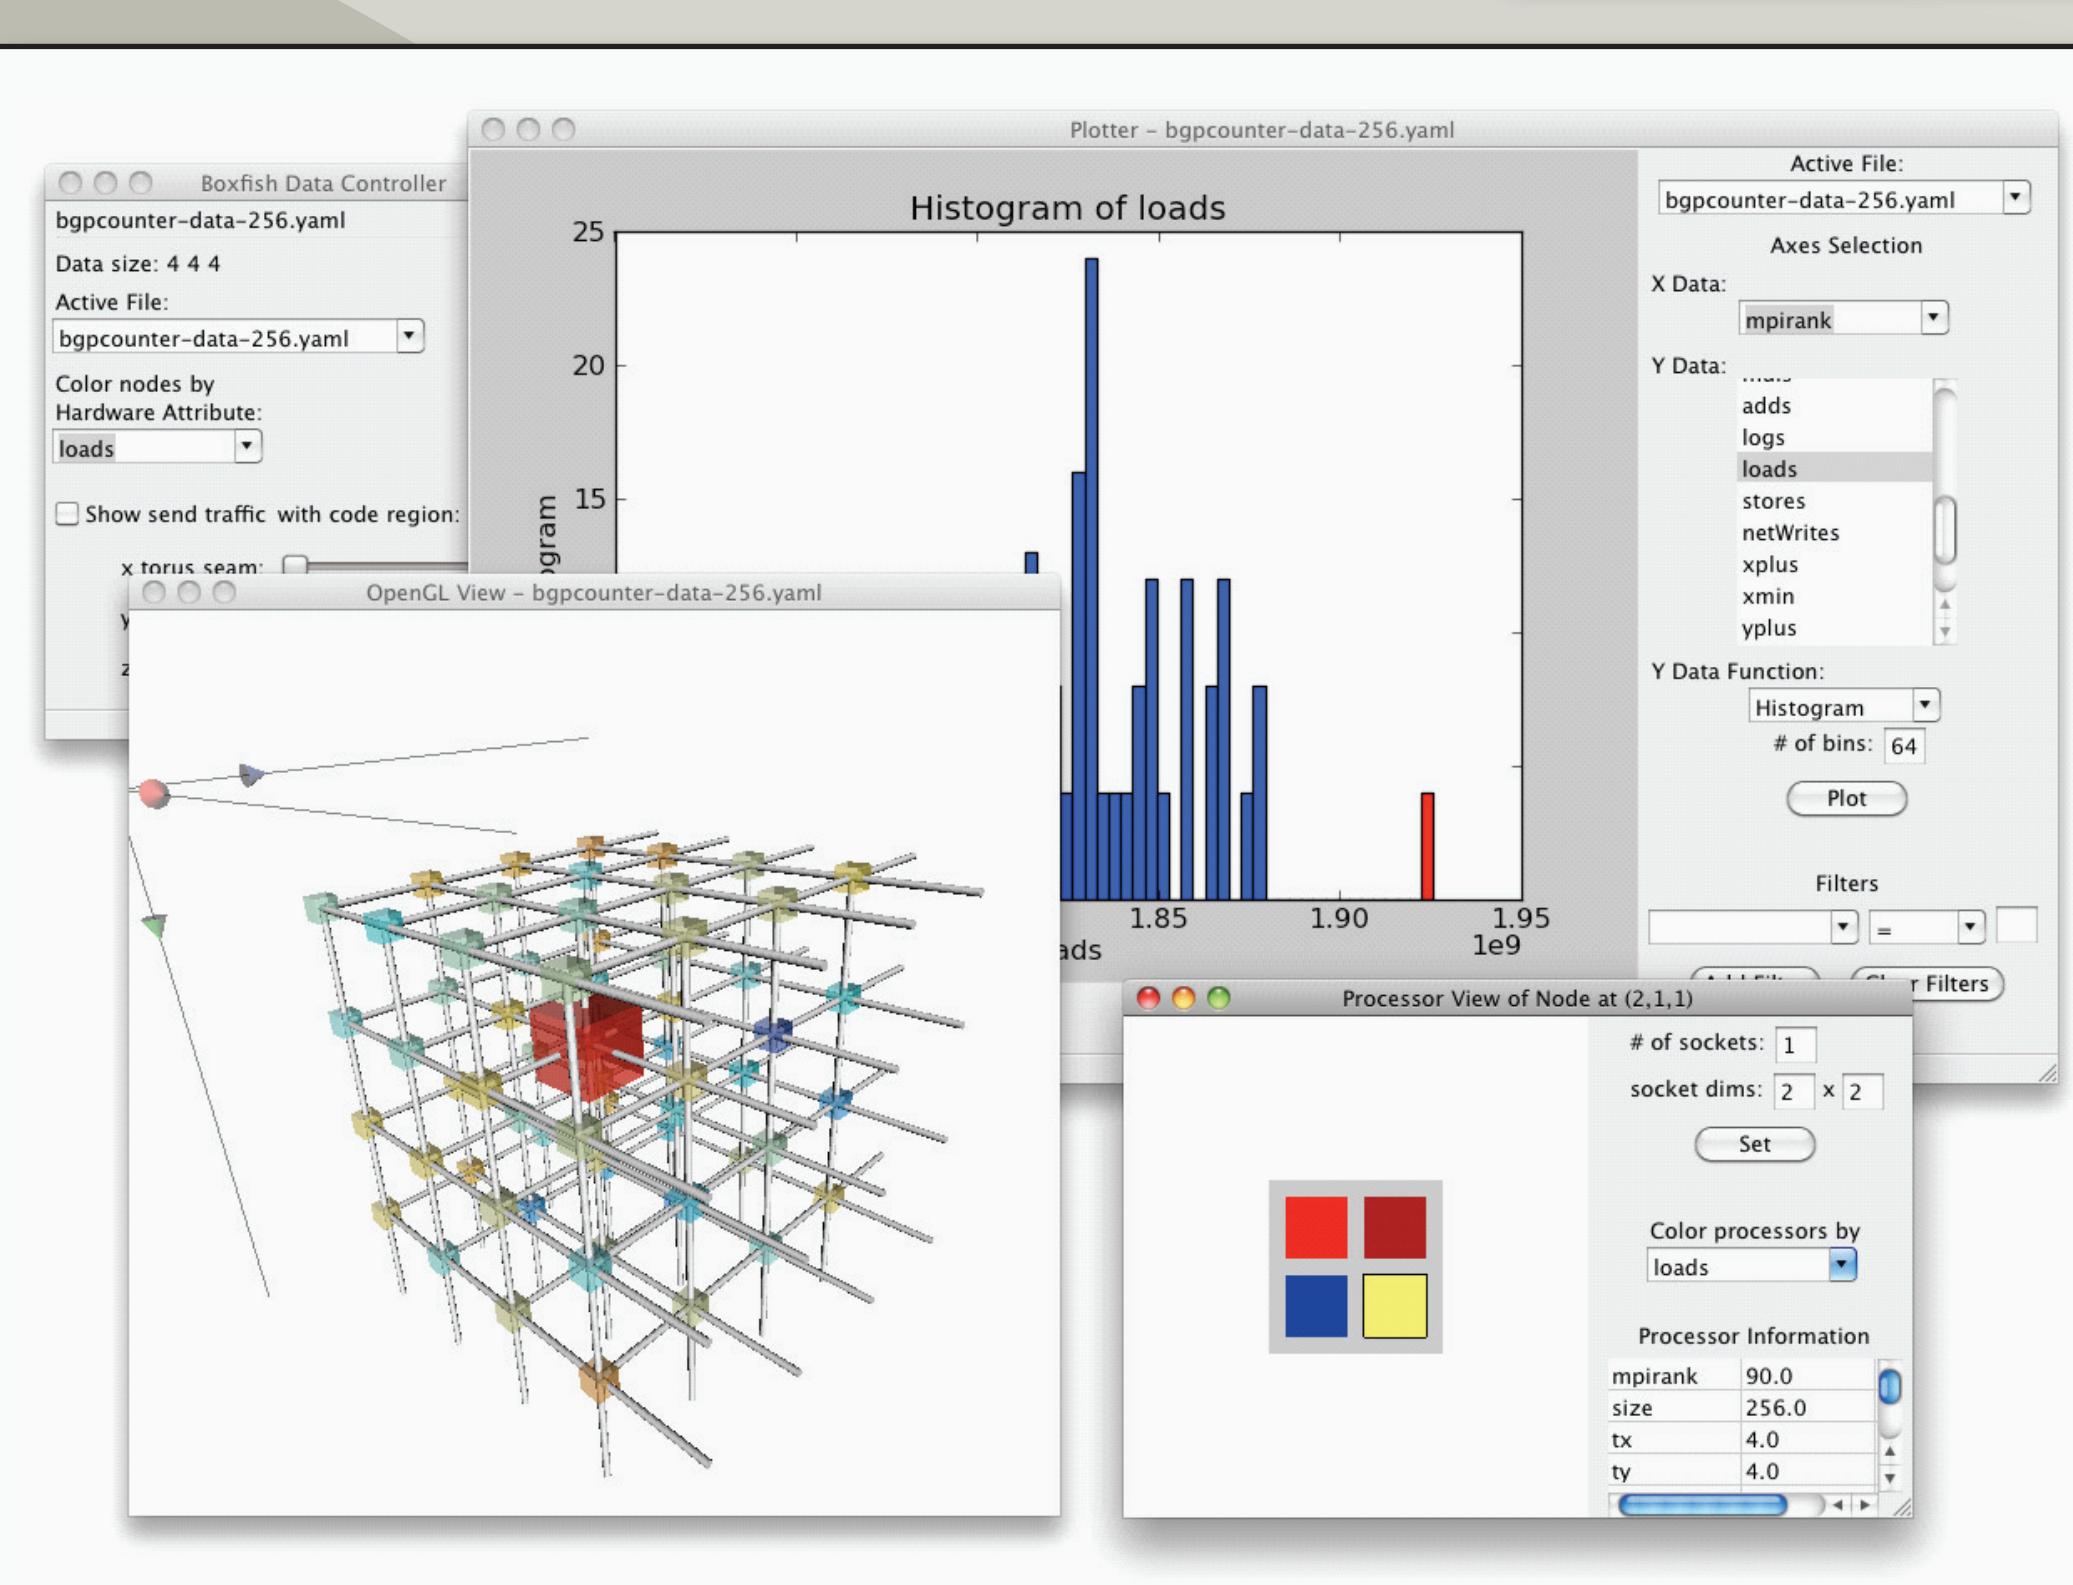

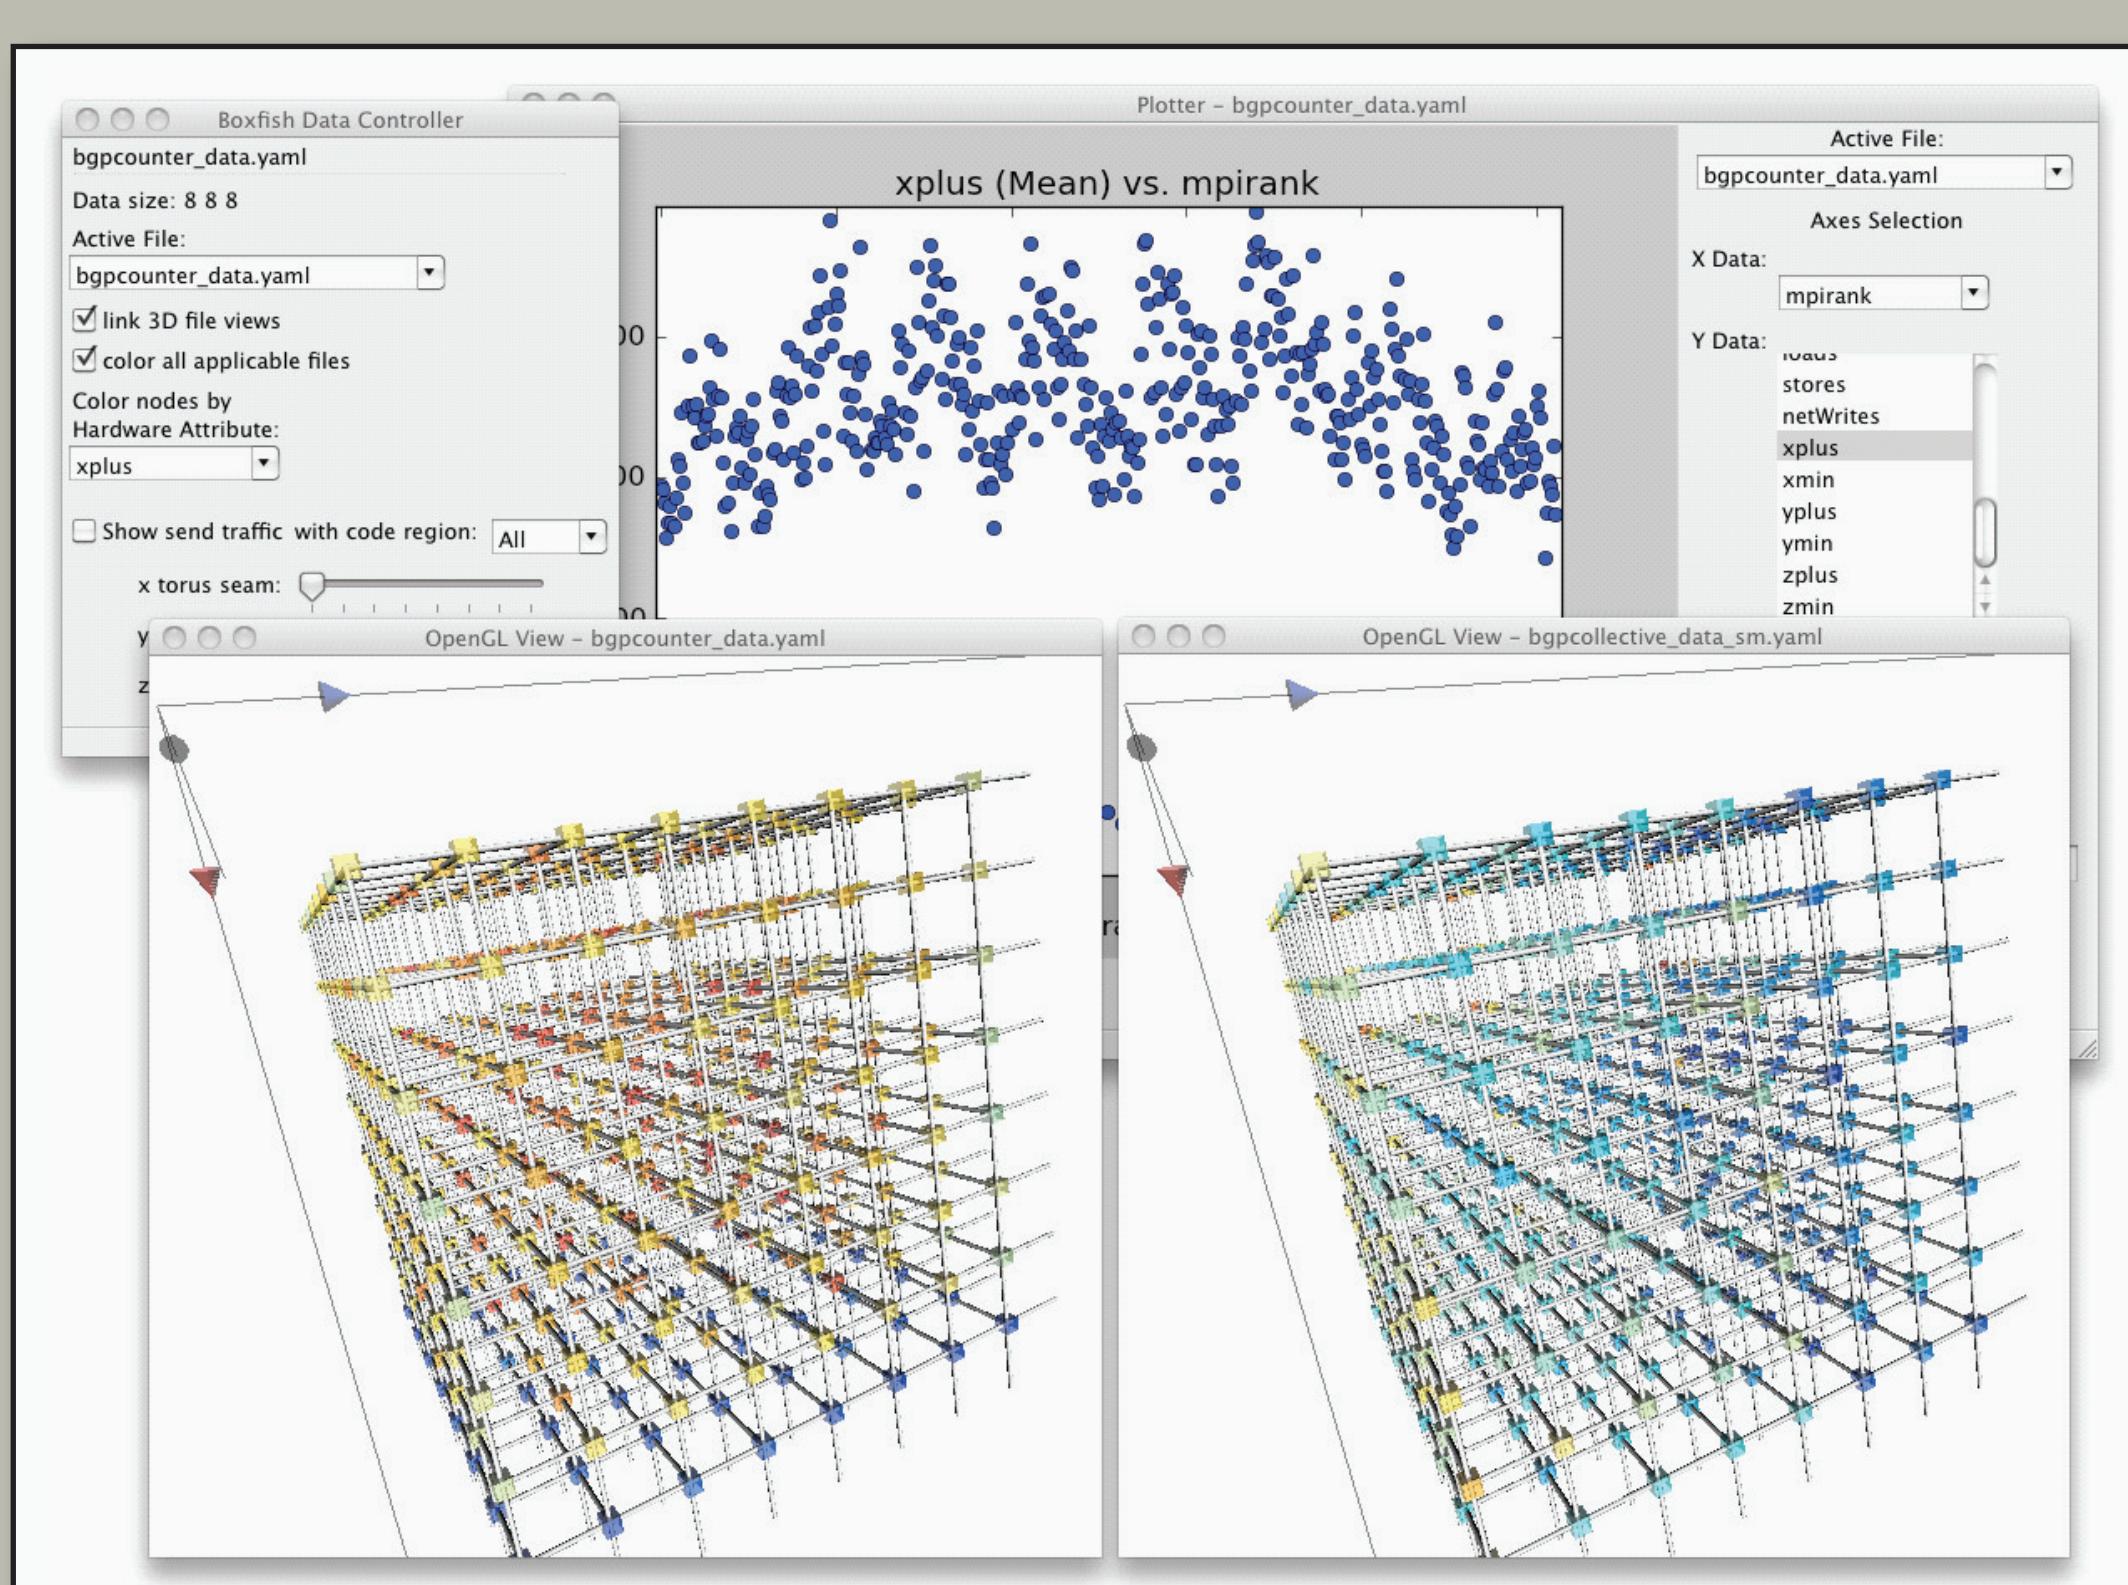

A supercomputer and simulation of traversal of laser beams

PAVE Tool

- This tool represents the supercomputer as a grid of nodes
- Combined analysis of the 2D and 3D views gives better insight into working of the program
- User can map the output of the simulations to the various nodes of the supercomputer
- Performance metrics can be viewed at various granularities like cluster level and node level.

Right: Simulation output viewed at various time steps Left: Behavior of the L1 cache misses of the various nodes used for the simulation during the same time steps. Notice the wave front in the image.
