Fitting Parametric Models: Beyond Lines

- Choose a parametric model to represent a set of features

simple model: **lines**

simple model: **circles**

complicated model: **car**

Finding Circles by Hough Transform

Equation of Circle: $(x_i - a_0)^2 + (y_i - b_0)^2 = r^2$

Finding Circles by Hough Transform

Equation of Circle: $(x_i - a_0)^2 + (y_i - b_0)^2 = r^2$

If radius r is known:

Example: Set of circles

http://www.avishek.net/blog/wp-content/uploads/2011/07/circles_hough.gif

Finding Circles by Hough Transform

If r is not known

Use accumulator array $A(a,b,r)$

For each (x_i, y_i) increment $A(a,b,r)$

such that $(x_i - a)^2 + (y_i - b)^2 = r^2$

**Parameter curves
represent right cone.**

HT for Circles

Each point in image space: Accumulate right cone in (a,b,r) accumulator.

Finding Coins

Original

Edges (note noise)

Finding Coins (Continued)

Penn

Quarter

Finding Coins (Continued)

Note that because the quarters and penny are different sizes, a different Hough transform (with separate accumulators) was used for each circle size.

Coin finding sample images from: Vivek Kwatra

Real World Circle Examples

Crosshair indicates results of Hough transform, bounding box found via motion differencing.

Java Demos

How to avoid 3D accumulator: Maximum Projection

How to avoid 3D accumulator: Maximum Projection

fig. 4: Circular boundary detection

- a) (most difficult) subframe of original image
- b) overlay of original image and classification result (black circles)

- c) edge-features used for matching
- d) pointer vectors directing from surviving counts to contributing boundary points (grey indicates pointer orientation)
- e) accumulator plane of evident center coordinates (scale-axis projected)
- f) surviving accumulator counts after backmapping

See: Gerig et al., ICCV'87

If radius r and edge orientation known

Search for center reduces from circle to two locations only.

Radius not known:

Search for center
reduces from
accumulation of cone
to two lines only.

Using Gradient Information

- Gradient information can save lot of computation:

Edge Location (x_i, y_i)

Edge Direction ϕ_i

Assume radius is known:

$$a = x - r \cos \phi$$

$$b = y - r \sin \phi$$

Need to increment only one point in Accumulator!!,
Assuming not only orientation by direction is known.

What about general objects?

complicated model: **car**

Generalized Hough Transform

- Model Shape NOT described by equation but by **sets of vectors from the boundary to the center**.

Model :

GENERALIZING THE HOUGH TRANSFORM TO
DETECT ARBITRARY SHAPES*

D. H. BALLARD

Computer Science Department, University of Rochester, Rochester, NY 14627, U.S.A.

(Received 10 October 1979; in revised form 9 September 1980; received for
publication 23 September 1980)

Generalized Hough Transform

- Model Shape NOT described by equation but by sets of vectors from the boundary to the center, **sorted by edge orientation**.

ϕ -Table

Edge Direction	$\vec{\pi} = (\pi, \alpha)$
ϕ_1	$\pi_1^1, \pi_2^1, \pi_3^1$
ϕ_2	π_1^2, π_2^2
$\vdots$	$\vdots$
ϕ_i	π_1^i, π_2^i
$\vdots$	$\vdots$
ϕ_n	π_1^n, π_2^n

Generalized Hough transform

- We want to find a shape defined by its boundary points and a reference point

D. Ballard, [Generalizing the Hough Transform to Detect Arbitrary Shapes](#), Pattern Recognition 13(2), 1981, pp. 111-122.

Generalized Hough transform

- We want to find a shape defined by its boundary points and a reference point
- For every boundary point p , we can compute the displacement vector $r = a - p$ as a function of gradient orientation ϕ

D. Ballard, [Generalizing the Hough Transform to Detect Arbitrary Shapes](#), Pattern Recognition 13(2), 1981, pp. 111-122.

Generalized Hough Transform

Philipp Robel

Generalized Hough Transform

Find Object Center (x_c, y_c) given edges (x_i, y_i, ϕ_i)

Create Accumulator Array $A(x_c, y_c)$

Initialize: $A(x_c, y_c) = 0 \quad \forall (x_c, y_c)$

For each edge point (x_i, y_i, ϕ_i)

For each entry $\overline{r}_k^i$ in table, compute:

$$x_c = x_i + r_k^i \cos \alpha_k^i$$

$$y_c = y_i + r_k^i \sin \alpha_k^i$$

Increment Accumulator: $A(x_c, y_c) = A(x_c, y_c) + 1$

Find Local Maxima in $A(x_c, y_c)$

Generalized Hough transform

- For model shape: construct a table storing displacement vectors r as function of gradient direction
- Detection: For each edge point p with gradient orientation ϕ :
 - Retrieve all r indexed with ϕ
 - For each $r(\phi)$, put a vote in the Hough space at $p + r(\phi)$
- Peak in this Hough space is reference point with most supporting edges
- ***For orientation and scaling: “Transform” table by updating edge orientation index and vectors, then repeat procedure as above.***

Scale & Rotation :

Use : Affine transformation A :

$$A(x_c, y_c, S, \theta)$$

Use. :

$$x_c = x_i + x'_k S \cos(\alpha_k + \theta)$$

$$y_c = y_i + x'_k S \sin(\alpha_k + \theta)$$

$$A(x_c, y_c, S, \theta) = A(x_c, y_c, S, \theta) + 1.$$

Application: MRI motion correction

Figure 3: Readjustement of image to cover the model-curve (warp and bicubic fit)

Result: Temporal Functions of Glomerular Filtration

What about templates rather than contour points?

Basic Idea:

- **Train objects as sets of gray-level templates linked via an object center**
- **Find objects in new images via matching these templates and voting towards the center.**

Credit to following slides: Svetlana Lazebnik, University of Illinois at Urbana-Champaign ([slides](#))

Generalized Hough transform

- We want to find a template defined by its reference point (center) and several distinct types of landmark points in stable spatial configuration

Template

Generalized Hough transform

- Template representation:
for each type of landmark
point, store all possible
displacement vectors
towards the center

Template

Model

Generalized Hough transform

- Detecting the template:
 - For each feature in a new image, look up that feature type in the model and vote for the possible center locations associated with that type in the model

Test image

Application in recognition

- Index displacements by “visual codeword”

training image

visual codeword with
displacement vectors

B. Leibe, A. Leonardis, and B. Schiele, [Combined Object Categorization and Segmentation with an Implicit Shape Model](#), ECCV Workshop on Statistical Learning in Computer Vision 2004

Application in recognition

- Index displacements by “visual codeword”

test image

B. Leibe, A. Leonardis, and B. Schiele, [Combined Object Categorization and Segmentation with an Implicit Shape Model](#), ECCV Workshop on Statistical Learning in Computer Vision 2004

Implicit shape models: Training

1. Build *codebook* of patches around extracted interest points using clustering (more on this later in the course)

Implicit shape models: Training

1. Build *codebook* of patches around extracted interest points using clustering
2. Map the patch around each interest point to closest codebook entry

Implicit shape models: Training

1. Build *codebook* of patches around extracted interest points using clustering
2. Map the patch around each interest point to closest codebook entry
3. For each codebook entry, store all positions it was found, relative to object center

Implicit shape models: Testing

1. Given test image, extract patches, match to codebook entry
2. Cast votes for possible positions of object center
3. Search for maxima in voting space
4. Extract weighted segmentation mask based on stored masks for the codebook occurrences

Additional examples

B. Leibe, A. Leonardis, and B. Schiele, [Robust Object Detection with Interleaved Categorization and Segmentation](#), IJCV 77 (1-3), pp. 259-289, 2008.

Implicit shape models: Details

- Supervised training
 - Need reference location and segmentation mask for each training car
- Voting space is continuous, not discrete
 - Clustering algorithm needed to find maxima
- How about dealing with scale changes?
 - Option 1: search a range of scales, as in Hough transform for circles
 - Option 2: use interest points with characteristic scale
- Verification stage is very important
 - Once we have a location hypothesis, we can overlay a more detailed template over the image and compare pixel-by-pixel, transfer segmentation masks, etc.

Hough transform: Discussion

- Pros
 - Can deal with non-locality and occlusion
 - Can detect multiple instances of a model
 - Some robustness to noise: noise points unlikely to contribute consistently to any single bin
- Cons
 - Complexity of search time increases exponentially with the number of model parameters
 - Non-target shapes can produce spurious peaks in parameter space
 - It's hard to pick a good grid size
