

Mesh Data Structures

Polygonal Meshes

■ Components

- ◆ Connectivity (Vertices, Edges, Faces)
- ◆ Geometry (Vertex Coordinates)
- ◆ Properties (Normals, Colors, Texture Coordinates)

■ Connectivity (combinatorial algorithms)

- ◆ Boundary / Regular / Singular Edges and Vertices
- ◆ Connected Components
- ◆ **Manifold** / Non-manifold
- ◆ Orientable / Oriented
- ◆ Topology

Operations

Draw (\otimes Compute normals)

Rotate

Cut (with plane, cut patch, etc)

Unfold patch

Find shortest paths between vertices

Operations

Visit all vertices / faces / edges

Find all vertices of a face (ordered)

Find all vertices / faces adjacent to a vertex

Face opposite face, across edge

Create / destroy vertex / face / edge

Objects

Triangles / polygons

Holes

Manifold

Orientable

www.kleinbottle.com

Taubin, Sig'01 Course 17

Connectivity / Classification of Elements

- Edges
 - ◆ Boundary (1 incident face)
 - ◆ Regular (2 incident faces)
 - ◆ Singular (3 or more incident faces)
- Vertices
 - ◆ Regular / Singular
- Connected components
 - ◆ Connected Components of Dual Graph

Manifold Meshes

- No singular edges
 - ◆ Boundary
 - ★ Edge with 1 incident face
 - ◆ Regular
 - ★ Edge with 2 incident faces
- No singular vertices
 - ◆ Boundary
 - ★ dual graph of set of incident faces form a path
 - ◆ Regular
 - ★ dual graph of set of incident faces form a cycle
- Data Structure to represent and operate on ?

Polygon Soup

Draw: $O(n)$ – ☺ Vertex neighbor – ??

Larson

FACE TABLE

F ₁	(x ₁ , y ₁ , z ₁) (x ₂ , y ₂ , z ₂) (x ₃ , y ₃ , z ₃)
F ₂	(x ₂ , y ₂ , z ₂) (x ₄ , y ₄ , z ₄) (x ₃ , y ₃ , z ₃)
F ₃	(x ₂ , y ₂ , z ₂) (x ₅ , y ₅ , z ₅) (x ₄ , y ₄ , z ₄)

Adjacency Lists

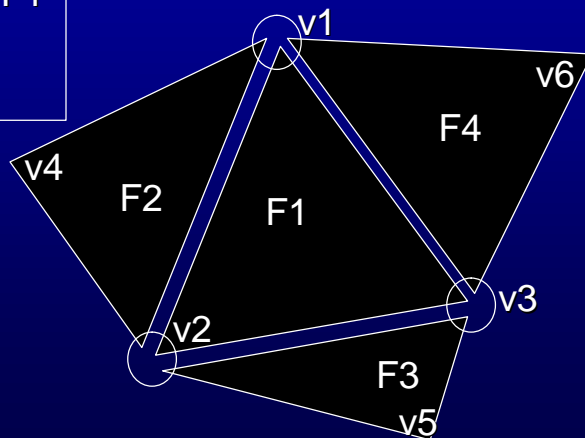

Topology stored in triangles

Adjacency Lists

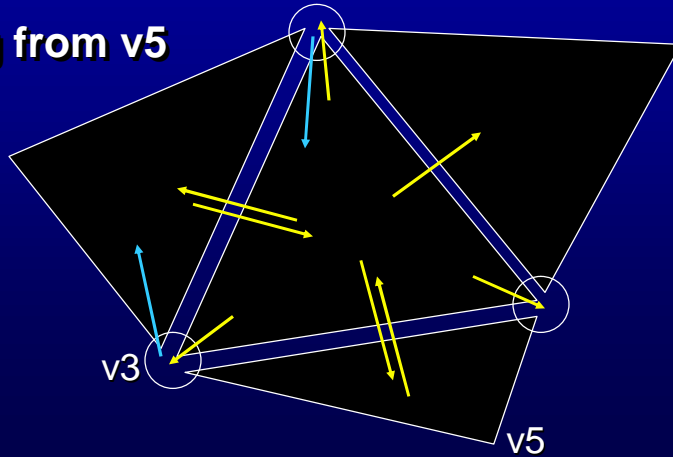

F1	v1 v2 v3	F3 F4 F2
F2	v2 v1 v4	F1
F3	v2 v5 v3	F1
F4	v3 v6 v1	F1

v1	F4
v2	F1
v3	F4
v4	F2
...	

Adjacency Lists

Walk around vertex
v3 starting from v5

Adjacency Lists

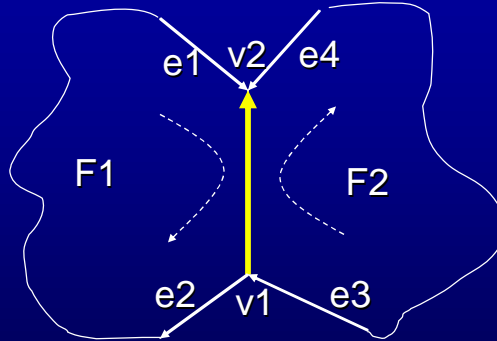

Draw 😊

Manage 😊

Traverse 😊

Polygons: variable storage / face 😞

Winged Edge [Baumgart '75]

Org	Dest	Left	Right	Lprev	Lnext	Rprev	Rnext
v1	v2	F1	F2	e1	e2	e3	e4

Winged Edge

Edges store topology (fixed size)

Faces, vertices point to 1 adjacent edge

Can represent non-orientable surfaces

Traversing: test orientation

Holes

Faces point to >1 edge
(contour)

OR

Auxiliary edges

Half-Edge [Eastman '82]

Orientable manifold

Oriented edge

Non-oriented edge

(prevEdge)
nextEdge
symEdge
origin vertex

Half-Edge

Faces, vertices point to 1 edge

Dest: $\text{Org}(\text{Sym}(\text{he}))$

Opp Face (he): $\text{Sym}(\text{he})$

CCW(he, $v=\text{Org}(\text{he})$):
 $\text{Sym}(\text{Prev}(\text{he}))$

Holes

Faces point to >1 edge
(contour)

OR

Auxiliary edges

Quad-Edge

Dual: Faces \ll Vertices; Edges \ll Edges

Application: Voronoi / Delaunay

Quad Edge [Giubas & Stolfi '85]

QuadEdge: Edge[4]

Edge:

- Index (0..3)
- Next
- Origin

Sym?

Dest?

Quad-Edge

Vertices/Faces symmetrical

Rings of Quad Edges

- duplicate coords or use pointers

Lischinski

Build Meshes

Make Edge

Splice

Triangle-Edge [Muecke '93]

[Dobkin-Lazlo] Edge-Facet
 extend Quad-Edge to 3-manifolds

Triangle-Edge: simplification for
 triangulations

Mucke

Triangle-Edge

Edge rings, Face rings

Mucke

Triangle Edge

Triangle-Edge $\langle f, e \rangle = f * 6 + e_orient$

Store neighbor triangles, 3 vertices

Edge rings obtained by index manipulation

```

type Triangle = record
  origin: array [0..2] of Integer;
  next_f: array [0..5] of Integer; ← (0..2 for 2-manifold)
end;

const
  vo: array [0..5] of Integer ← {0, 1, 1, 2, 2, 0};
  ve: array [0..5] of Integer ← {2, 5, 4, 1, 0, 3};

var tr: dynamic array [0..*] of Triangle;

```

Mucke

Triangle-Edge

$$\langle \langle \dots, a, \overbrace{\dots}^{ii}, b, \dots \rangle \rangle \xrightarrow{\text{fsplice}(a,b)} \langle \langle a, \dots, \overbrace{\dots}^{iii}, \overbrace{\dots}^i \rangle \rangle \neq \langle \langle b, \overbrace{\dots}^{ii} \rangle \rangle$$

```

procedure fsplice(a, b) is
  swap pointers a, b;
  swap pointers a.fnext.sym, b.fnext.sym;
end;

```

```

refinement swap pointers a, b is
  assert a = ⟨fa, va⟩ and b = ⟨fb, vb⟩;
  tr[fa].next_f[va] ↔ tr[fb].next_f[vb];
end;

```

Mucke

Triangle-Edge

Fsplice, Fmerge: link faces

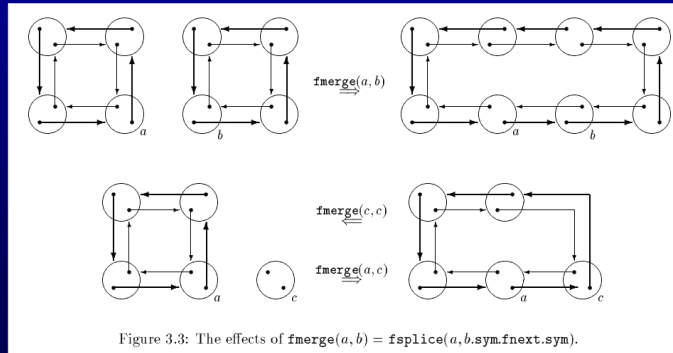

Figure 3.3: The effects of $fmerge(a, b) = fsplice(a, b, sym, fnext, sym)$.
