

# ViSUS

ViSUS is a technology for efficient and scalable storage, processing and delivery of high-resolution images. ViSUS technology has the unique ability to be scalable across a wide range of computing resources and degrade performance very gracefully on low-power/low-performance devices.

# Deployment

We plan to deploy the ViSUS technology at least in four application areas. The work in each of the areas will require developing the proper user interfaces and/or the integration within existing tools.

- ▶ Digital Photography
- ▶ Interactive Entertainment
- ▶ Intelligence
- ▶ Remote Medicine
- ▶ Components/plugin-ins for other applications

The work is coordinated between (i) horizontal technology development of the core infrastructure leveraged along multiple targets, and (ii) vertical tool development addressing the specific needs of an application.
