

Klinik für Radiologie UK Münster Eddy current contraction result of rapidly changing gradient magnetic fields that in turn induce stray currents in the surrounding conducting materials • in all forms of echo-planar imaging, eddy current gradients and field shifts produce distinctive geometric image distortions. These include: shear • 1) image shearing artifacts (from induced gradients in the frequency-encode direction); 2) image scaling artifacts (from induced gradients in • the phase-encode direction), and • 3) global position shifts (from homogenous shifts in the **B**_o field).
